

APPLICATION INFORMATION

UNBALANCED STEREO HEADPHONE-LEVEL SIGNAL SOURCE

CONTROLS:

AUDIO INPUT:

3.5 mm stereo mini phone jack accepts signals from unbalanced headphone-level sources such as MP3/CD/DVD players and computer audio cards.

STEREO/MONO SWITCH:

Rocker-type switch provides input summing to combine stereo sources for mono output for applications where stereo operation is not required.

L/R:

RCA phono-type jackwired in parallel to the STEREO mini input.

GROUND LIFT:

Rocker-type switch used to reduce hum and buzz by eliminating ground loops and providing proper grounding for various situations. Breaks connection point between input and output electrostatic shields.

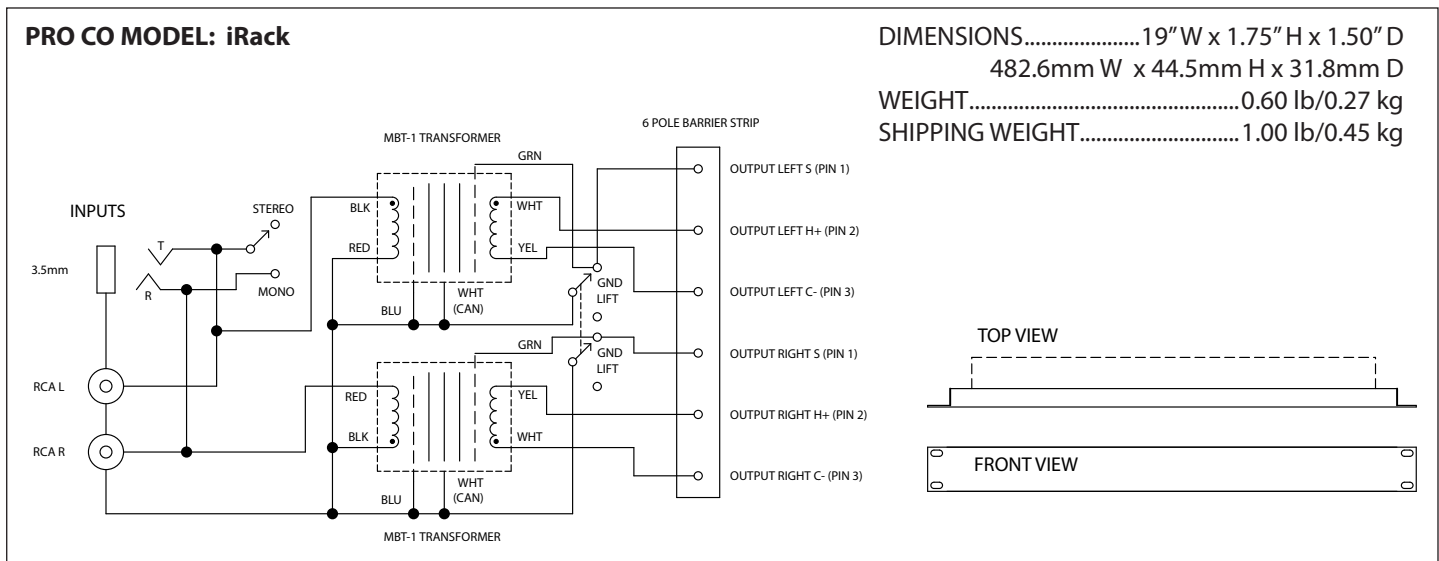

NOTES:

1. inputs of the iRack Portable Audio Player Interface unit are intended for unbalanced stereo headphone-level sources. **It is not intended for line-level sources such as the right and left line-level outputs of a Cassette, CD or CD/DVD player.** Pro Co manufactures several TradeTools devices that will correctly interface balanced or unbalanced line-level sources with professional mixing consoles. Please consider a Pro Co DB1, DB2, AV1A or IT1 as a solution for your interface depending upon your specific application.

2. L/R BALANCED OUTPUTS located on the 6 pole barrier strip on the back of the plate are connected to microphone input of house P.A. mixer or recording console.

3. GND/LIFT switch settings assume the mixer is also the central ground reference point for the system. **For safety reasons all equipment should be equipped with 3-wire AC power cords and plugged into properly grounded receptacles.** Use of the GND/LIFT switch should minimize hum and buzz. If GND/LIFT switch seems non-functional, check wiring of cable plugged into the LO-Z OUTPUT. A cable with a jumper between pin 1 and the connector shell will defeat the GND/LIFT switch.
